Received 6 May 2013; accepted 13 May 2013

Key indicators: single-crystal X-ray study;  $T = 90$  K; mean  $\sigma(\text{C}-\text{C}) = 0.002$  Å;  $R$  factor = 0.024;  $wR$  factor = 0.059; data-to-parameter ratio = 11.6.

The title compound,  $[\text{Co}^{\text{II}}(\text{C}_2\text{H}_8\text{N}_2)_3]\text{Cl}_2$ , was obtained unexpectedly as the product of an attempted solvothermal synthesis of cobalt selenide from the elements in the presence of  $\text{NH}_4\text{Cl}$  in ethylenediamine solvent. The three chelate rings of the distorted octahedral  $[\text{Co}(\text{C}_2\text{H}_8\text{N}_2)_3]^{2+}$  complex cation adopt twisted conformations about their C—C bonds. The spread of *cis*-N—Co—N bond angles  $[80.17(6)–98.10(6)^\circ]$  in the title compound is considerably greater than the equivalent data for  $[\text{Co}^{\text{III}}(\text{C}_2\text{H}_8\text{N}_2)_3]\text{Cl}_3$  [Takamizawa *et al.* (2008). *Angew. Chem. Int. Ed.* **47**, 1689–1692]. In the crystal, the components are linked by numerous N—H $\cdots$ Cl hydrogen bonds, generating a three-dimensional network in which the cationic complexes are stacked in columns along  $[010]$  and separated by columns of chloride anions.

## Related literature

The corresponding  $\text{Co}^{\text{III}}$ -tris-ethylenediamine complex with chloride counter-anions has been reported by Takamizawa *et al.* (2008).

## Experimental

### Crystal data

$[\text{Co}(\text{C}_2\text{H}_8\text{N}_2)_3]\text{Cl}_2$	$V = 2837.0(6)$ Å <sup>3</sup>
$M_r = 310.14$	$Z = 8$
Orthorhombic, <i>Pbca</i>	Cu $K\alpha$ radiation
$a = 8.1590(8)$ Å	$\mu = 12.81$ mm <sup>−1</sup>
$b = 17.047(3)$ Å	$T = 90$ K
$c = 20.3974(14)$ Å	$0.31 \times 0.17 \times 0.15$ mm

### Data collection

Bruker APEXII CCD diffractometer	17930 measured reflections
Absorption correction: multi-scan ( <i>SADABS</i> ; Bruker, 2003)	2700 independent reflections
$T_{\min} = 0.109$ , $T_{\max} = 0.243$	2437 reflections with $I > 2\sigma(I)$
	$R_{\text{int}} = 0.042$

### Refinement

$R[F^2 > 2\sigma(F^2)] = 0.024$	232 parameters
$wR(F^2) = 0.059$	All H-atom parameters refined
$S = 1.06$	$\Delta\rho_{\max} = 0.26$ e Å <sup>−3</sup>
2700 reflections	$\Delta\rho_{\min} = -0.37$ e Å <sup>−3</sup>

**Tris(ethylenediamine)cobalt(II) dichloride**

**Kristin Cooke, Andrei V. Olenov and Kirill Kovnir**

**Comment**

In the chiral Co(II)(en)<sub>3</sub> cationic complex (Fig. 1) N atoms form distorted octahedron around central Co atom, *cis* angles deviate from 90° by less than 10°. Both  $\Lambda$  and  $\Delta$  isomers are present in equal amounts in the centrosymmetric crystal structure.

Co(en)<sub>3</sub> cationic complexes are stacked in columns along [010] direction (Figure 2) and separated by the columns of Cl anions. There two types of chlorine anions in the crystal structure. Cl1 has distorted octahedral coordination by 6 hydrogen atoms from 4 different Co(en)<sub>3</sub> complexes. Cl2 has distorted trigonal bipyramid coordination by 5 hydrogen atoms from 2 different Co(en)<sub>3</sub> complexes. H...Cl distances vary from 2.45 to 2.70 Å.

The corresponding Co(III) trisethylenediamine complex with chloride counter-anions has been reported. (Takamizawa *et al.*, 2008). The Co(III)(en)<sub>3</sub> cationic complex is more regular: *cis* angles deviate from 90° by less than 4°.

**Experimental**

The title compound, [Co(C<sub>2</sub>N<sub>2</sub>H<sub>8</sub>)<sub>3</sub>]Cl<sub>2</sub>, was obtained unintentionally as the product of an attempted synthesis of cobalt selenide. Co (64 mg), Se (86 mg), and NH<sub>4</sub>Cl (100 mg) were reacted in ethylenediamine (en) solvent (30 ml). Reaction was performed in closed hydrothermal vessel at 180°C for 48 h. Degree of the vessel filling was 70%. Irregular moisture-sensitive yellow crystals of the title compound were recovered.

**Refinement**

H atoms bonded to N and C atoms were located in a difference Fourier maps and refined without any restraints.

**Computing details**

Data collection: *APEX2* (Bruker, 2003); cell refinement: *SAINT* (Bruker, 2003); data reduction: *SAINT* (Bruker, 2003); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008); molecular graphics: Mercury (Macrae *et al.*, 2008); software used to prepare material for publication: *SHELXL97* (Sheldrick, 2008).

**Figure 1**

### Data collection

Bruker APEXII CCD diffractometer	17930 measured reflections
Radiation source: fine-focus sealed tube	2700 independent reflections
Graphite monochromator	2437 reflections with $I > 2\sigma(I)$
$\varphi$ and $\omega$ scans	$R_{\text{int}} = 0.042$
Absorption correction: multi-scan (SADABS; Bruker, 2003)	$\theta_{\text{max}} = 72.0^\circ$ , $\theta_{\text{min}} = 4.3^\circ$
$T_{\text{min}} = 0.109$ , $T_{\text{max}} = 0.243$	$h = -9 \rightarrow 9$
	$k = -19 \rightarrow 20$
	$l = -24 \rightarrow 18$

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.024$	All H-atom parameters refined
$wR(F^2) = 0.059$	$w = 1/[\sigma^2(F_o^2) + (0.0273P)^2 + 1.3198P]$
$S = 1.06$	where $P = (F_o^2 + 2F_c^2)/3$
2700 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
232 parameters	$\Delta\rho_{\text{max}} = 0.26 \text{ e } \text{\AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.37 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
